

-
- TDC boards fail at a rate of up to one/week (there are ~400 boards total)
 - DONE timeouts from a single TDC crate, not recovered by HRR:
 - ➔ reset_crate, then vxlogin to crate, then bring it back with “Local Client Controller”
 - ➔ Again DONE timeout? Try again!
 - ➔ Again DONE timeout? Page TDC pager! Identify “bad” TDC from error messages.
 - reset_crate != reboot
 - reset_crate != “Reset” transition
 - In general, *excluding a TDC from the readout requires expert intervention:*
“TDCReadoutMode” needs to be changed in the hardware DB
 - ➔ Just moving a TDC from the left to the right in run control does *not* change the TDCReadoutMode. In most cases, one will just get “timeout on global TDC Done” errors
 - ➔ Will see if we can make this (semi-)automatic
 - If there is a “clock glitch”, *many* COT crates will give DONE timeouts
 - ➔ Don't try to recover from this. Just end and start a new run.
